### INCIDENT SUMMARY

The well operator was monitoring injection wells, and he noticed a loss in pressure to one well. This caused the pumps at the main station to go down. He went to check on the problem and shut off the header. At about that same time, someone else located the leak causing the pressure decrease. It was off location and coming out of the ground. Approximately 10 barrels of injection water were released. Only soil was affected. The company has planned for remediation to commence this morning. The BLM and UDOGM have already been notified.
